Abstract

5

10

The invention is based on a braking device for an electric motor having a rotor (10) and a stator, in particular for a direct current series wound motor, having a brake element (20) which is movable between a braking position and an operating position; a brake shoe (30) that brakes the rotor (10) in the braking position is mounted on the brake element (20). It is proposed that the brake shoe (30) be mounted on the brake element (20) on the trailing end relative to the direction of rotation of the rotor (10).
